ElELYso

Description

ElELYso (taliglucerase alfa)

Background

Gaucher disease is an inherited lysosomal storage disorder in humans that results in the inability to produce glucocerebrosidase, an enzyme necessary for fat metabolism. The enzyme deficiency causes lipids to collect in the spleen, liver, kidneys, and other organs. Accumulation of lipids in these areas results in the enlargement of the liver and spleen, anemia, thrombocytopenia, lung disease and bone abnormalities. Symptoms of Gaucher disease usually become apparent in early childhood or adolescence but can be diagnosed at any stage of life. It is important to begin intervention early to prevent damage to the liver and spleen (1).

ElELYso is an injectable enzyme replacement product for the treatment of adults with type 1 Gaucher disease. There are three clinical subtypes of Gaucher disease differentiated by the presence or absence of neurological involvement: type 1, type 2 and type 3. Type 1, known as non-neuronopathic, is the most common. There is insufficient evidence supporting the use of ElELYso for the treatment of type 2 and type 3 Gaucher disease (1).

Regulatory Status

FDA-approved indication: ElELYso is a hydrolytic lysosomal glucocerebroside-specific enzyme indicated for the treatment of patients 4 years and older with a confirmed diagnosis of type 1 Gaucher disease (1).

Section:	Prescription Drugs	Effective Date:	July 1, 2024
Subsection:	Hematological Agents	Original Policy Date:	August 3, 2012
Subject:	Elelyso	Page:	2 of 5

Elelyso has a boxed warning regarding hypersensitivity reactions including anaphylaxis. Elelyso should be administered in a healthcare setting with appropriate medical monitoring and support measures, including access to cardiopulmonary resuscitation equipment (1).

The safety of Elelyso has not been established in pediatric patients younger than 4 years of age (1).

Policy

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Elelyso may be considered **medically necessary** if the conditions indicated below are met.

Elelyso may be considered **investigational** for all other indications.

Prior-Approval Requirements

Age 4 years of age and older

Diagnosis

Patient must have the following:

Gaucher disease, Type 1

AND the following:

1. **NO** dual therapy with another medication for Type 1 Gaucher disease (see Appendix 1)

Prior-Approval *Renewal* Requirements

Same as above

Policy Guidelines

Pre - PA Allowance

None

Section:	Prescription Drugs	Effective Date:	July 1, 2024

Subject:	Elelyso	Page:	3 of 5

Prior - Approval Limits

Duration 2 years

Prior-Approval *Renewal* Limits

Same as above

Rationale

Summary

Gaucher disease is an inherited lysosomal storage disorder in humans that results in the inability to produce glucocerebrosidase, an enzyme necessary for fat metabolism. The enzyme deficiency causes lipids to collect in the spleen, liver, kidneys, and other organs. Elelyso is a form of the human lysosomal enzyme, glucocerebrosidase, and is effective in replacing the enzyme deficiency in type 1 (non-neuronopathic) Gaucher disease. The safety of Elelyso has not been established in pediatric patients younger than 4 years of age (1).

Prior approval is required to ensure the safe, clinically appropriate, and cost-effective use of Elelyso while maintaining optimal therapeutic outcomes.
