## Scemblix

### Description

#### Scemblix (asciminib)

---

#### Background

Scemblix (asciminib) is an anticancer medicine that targets the BCR-ABL tyrosine kinase. The BCR-ABL tyrosine kinase (also called the Philadelphia chromosome) is found in most patients with chronic myelogenous leukemia (CML). The protein coded by the Philadelphia chromosome promotes a variety of pathways that lead to cellular proliferation of immune cells and prevent their destruction through apoptosis (programmed cell death), which can ultimately lead to cancerous changes. Scemblix specifically targets this BCR-ABL protein product and limits the oncologic changes by blocking its function (1-2).

#### Regulatory Status

FDA-approved indications: Scemblix is a kinase inhibitor indicated for the treatment of adult patients with: (1)

- Newly diagnosed Philadelphia chromosome-positive chronic myeloid leukemia (Ph+ CML) in chronic phase (CP).
- Previously treated Ph+ CML in CP.
- Ph+ CML in CP with the T315I mutation.

Scemblix can cause myelosuppression, pancreatic toxicity, hypertension, cardiovascular toxicity, and embryo-fetal toxicity. Patients should be monitored for thrombocytopenia and neutropenia with complete blood counts regularly. Additionally, serum lipase and amylase should be monitored, and pancreatitis evaluated if abdominal symptoms are also present. Blood pressure should be monitored, and hypertension managed as clinically indicated. In all cases of

toxicity or blood pressure elevation, the dose should be reduced, or treatment discontinued as appropriate. Females of reproductive potential should have their pregnancy status verified prior to starting treatment and should be advised to use effective contraception during treatment with Scemblix and for 1 week after the last dose (1).

The safety and effectiveness of Scemblix in pediatric patients have not been established (1).

#### Policy

*This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.*

Scemblix may be considered **medically necessary** if the conditions indicated below are met.

Scemblix may be considered **investigational** for all other indications.

## Prior-Approval Requirements

**Age** 18 years of age or older

### Diagnosis

Patient must have the following:

1. Philadelphia chromosome-positive chronic myeloid leukemia (Ph+ CML) in chronic phase

**AND ONE** of the following:

1. Patient has T315I mutation
2. Newly diagnosed CML
3. Previously treated CML

**AND** the following:

---

<b>Section:</b>	Prescription Drugs	<b>Effective Date:</b>	April 1, 2026
<b>Subsection:</b>	Antineoplastic Agents	<b>Original Policy Date:</b>	November 19, 2021
<b>Subject:</b>	Scemblix	<b>Page:</b>	3 of 5

---

1. Females of reproductive potential **only**: pregnancy status will be verified prior to starting treatment and patient will be advised to use effective contraception during treatment with Scemblix and for 1 week after the last dose

---

## Prior-Approval *Renewal* Requirements

**Age** 18 years of age or older

### Diagnosis

Patient must have **ONE** of the following:

1. Philadelphia chromosome-positive chronic myeloid leukemia (Ph+ CML) in chronic phase **without** T315I mutation
2. Philadelphia chromosome-positive chronic myeloid leukemia (Ph+ CML) in chronic phase **with** T315I mutation

**AND** the following:

1. Females of reproductive potential **only**: patient will be advised to use effective contraception during treatment with Scemblix and for 1 week after the last dose

### Policy Guidelines

## Pre-PA Allowance

None

## Prior-Approval Limits

### Quantity

Diagnosis	Quantity Limit
Ph+ CML <b>without</b> T315I mutation	80 mg per day <b>OR</b>
Ph+ CML <b>with</b> T315I mutation	400 mg per day

**Duration** 12 months

---

## Prior-Approval *Renewal* Limits

Same as above

---

---

## Rationale

### Summary

Scemblix (asciminib) is a BCR-ABL tyrosine kinase inhibitor indicated for the treatment of Philadelphia-chromosome positive chronic myelogenous leukemia (CML). Scemblix inhibits cellular proliferation and induces apoptosis in cells with the BCR-ABL mutation. Scemblix can cause myelosuppression, pancreatic toxicity, hypertension, cardiovascular toxicity, and embryo-fetal toxicity. The safety and effectiveness of Scemblix in pediatric patients have not been established (1).

Prior approval is required to ensure the safe, clinically appropriate, and cost-effective use of Scemblix while maintaining optimal therapeutic outcomes.
