Egrifra SV

Description

Egrifra SV (tesamorelin)

Background

Egrifra SV is approved by the FDA for HIV-associated lipodystrophy which is defined as a condition in which excess fat develops in different areas of the body, especially around the liver, stomach and other abdominal organs commonly observed in HIV-infected patients. Egrifra SV is a growth hormone releasing factor (GRF) analog that acts on pituitary cells in the brain to stimulate the production and release of endogenous growth hormone (1).

Egrifra SV stimulates growth hormone production and increases serum IGF-1. Given that IGF-1 is a growth factor and the effect of prolonged elevations in IGF-1 levels on the development or progression of malignancies is unknown, any pre-existing malignancy should be inactive, and treatment should be completed prior to initiating therapy with Egrifra SV. IGF-1 levels should be monitored closely during Egrifra SV therapy. Careful consideration should be given to discontinuing Egrifra SV in patients with persistent elevations of IGF-1 levels, particularly if the efficacy response is not robust (1).

Regulatory Status

FDA-approved indication:

Egrifra SV is a growth hormone releasing factor (GRF) analog indicated for the reduction of excess abdominal fat in HIV-infected patients with lipodystrophy (1).

Limitations of Use: (1)

Section:	Prescription Drugs	Effective Date:	April 1, 2026
Subsection:	Endocrine and Metabolic Drugs	Original Policy Date:	September 8, 2011
Subject:	Egrifita SV	Page:	2 of 5

- Long-term cardiovascular benefit and safety of Egrifita SV have not been established
- Not indicated for weight loss management (weight neutral effect)
- There are no data to support improved compliance with anti-retroviral therapies in HIV-positive patients taking Egrifita SV

Egrifita SV is contraindicated in women who are pregnant, in patients with disruption of the hypothalamic-pituitary axis due to hypophysectomy, hypopituitarism, pituitary tumor or surgery, head irradiation or head trauma, in patients with known hypersensitivity to Egrifita SV and or mannitol, and in patients with active malignancies. Egrifita SV therapy should be discontinued if pregnancy occurs; therefore, a positive pregnancy test prohibits therapy (1).

Preexisting malignancy should be inactive, and its treatment complete prior to starting Egrifita SV therapy (1).

Egrifita SV treatment may result in glucose intolerance. An increased risk of developing diabetes with Egrifita SV relative to placebo was observed. Therefore, glucose status should be carefully evaluated prior to initiating Egrifita SV treatment. Patients must have their glucose status checked routinely (1).

Related policies

Policy

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Egrifita SV may be considered **medically necessary** if the conditions indicated below are met.

Egrifita SV may be considered **investigational** for all other indications.

Prior-Approval Requirements

Age 18 years old or older

Diagnosis

Patient must have the following:

Section:	Prescription Drugs	Effective Date:	April 1, 2026
Subsection:	Endocrine and Metabolic Drugs	Original Policy Date:	September 8, 2011
Subject:	Egrifta SV	Page:	3 of 5

HIV-associated lipodystrophy with excess abdominal (visceral) fat

AND ALL of the following:

1. Concomitant antiretroviral therapy
2. No evidence of active malignancy
3. Females of reproductive potential **only**: patient must have a negative pregnancy test

Prior – Approval *Renewal* Requirements

Age 18 years old or older

Diagnosis

Patient must have the following:

HIV-associated lipodystrophy

AND ALL of the following:

1. Concomitant antiretroviral therapy
2. No evidence of active malignancy
3. Physician confirmation of glucose monitoring
4. Visceral adipose tissue (VAT) decrease as shown by a decrease in waist circumference or CT scan
5. Females of reproductive potential **only**: patient must have a negative pregnancy test

[Policy Guidelines](#)

Pre - PA Allowance

None

Prior - Approval Limits

Duration 3 months

Section:	Prescription Drugs	Effective Date:	April 1, 2026
Subsection:	Endocrine and Metabolic Drugs	Original Policy Date:	September 8, 2011
Subject:	Egrifita SV	Page:	4 of 5

Prior – Approval *Renewal* Limits

Duration 6 months

Rationale

Summary

Egrifita SV is approved for HIV-associated lipodystrophy in patients 18 years of age and older. It is contraindicated in women who are pregnant and preexisting malignancies. Treatment may result in glucose intolerance (1).

Prior approval is required to ensure the safe, clinically appropriate, and cost-effective use of Egrifita SV while maintaining optimal therapeutic outcomes.
